

ASX and Media Release

Dispatch of core samples from Penrhyn to Evergreen Energy's test facility

The drilling program at the Company's Penrhyn coal project south west of Coober Pedy in South Australia is almost finished. At the end of May, just 2 holes remained to be drilled out of a total program of 34.

Penrhyn will form part of the proposed joint venture with Evergreen Energy Inc (NYSE Arca:EEE) that was announced on 3 February 2011.

Two diamond core holes were drilled specifically to provide samples for testing at Evergreen's K-Fuel test facilities in Wyoming. Coal intersections have been dispatched and are expected to arrive shortly.

The drill core was carefully wrapped in plastic prior to its dispatch.

Penrhyn is a sub-bituminous coal deposit located 25 kilometres from the rail loading loop and a similar distance from the accommodation village and haul road that will be built for WPG's flagship Peculiar Knob iron ore project, so it is ideally situated to benefit from this infrastructure and the Company's Port Pirie export facility.

Drilling results to date are in line with expectations.
